FOREWORD

This is the seventh in the series of the publication entitled World Weather Records. The earlier issues, which included climatological information through 1970, have had global distribution and have been widely used for meteorological and climatological research. This volume provides data for North America for the 1971-80 period.

At its Sixth Session in Bad Homburg, Federal Republic of Germany, in October 1973, the Commission for Special Applications of Meteorology and Climatology (CoSamc) of the World Meteorological Organization, in Resolution 7, accepted the offer of the United States to publish the World Weather Records, 1961-70. The United States agreed to continue the publication of World Weather Records for the 1971-80 period. Under arrangements similar to those for the 1961-70 series, it was suggested that a data collector be assigned to each of the six Regional Associations to prepare all data and Station Notes for publication of the 1971-80 series.

The United States extends its gratitude to the meteorological services and other organizations who graciously supplied data. The United States collected data for Region IV. The present volume for North America contains data for all areas included in previous issues.

All data and Station Notes contained in this issue are as received by the United States, with the exception that obvious errors in arithmetic means and totals, and obvious dicontinuities were corrected and/or included in Station Notes. The United States is the publishing agent for World Weather Records; the responsibility for data quality rests with the individual national meteorological services.

This project has been carried out by personnel of the United States Department of Commerce's National Climatic Data Center. Task management, coordination, and computer programming for the project were by Mr. Peter M. Steurer. Editing of the data and station notes was performed by Mr. Philip Hysell and Mr. Henry Vigansky.

EDITORIAL NOTES

This issue of World Weather Records is primarily concerned with data for 1971-80. As in previous issues, data for earlier years have been included when appropriate and available. The first issue included data from earliest records available at that time up to 1920. Data for periods 1921-30, 1931-40, 1951-60, and 1961-70 were published in succeeding issues. The present volumes continue, insofar as possible the record of monthly mean values of station pressure, sea level pressure, temperature, and monthly total precipitation for stations listed in previous volumes. Some new stations have also been included.

Information concerning the exposure of instruments, hours of observation, and methods of adjusting or correcting observational data has been included in Station Notes whenever it was supplied.

SOURCES OF DATA

Unless otherwise stated in Station Notes, data were supplied to the Regional collector by national meteorological services whose addresses may be found in publications of the World Meteorological Organization. With some exceptions, the data have been published as received by the United States from the meteorological services. CLINO data are long term means taken from the World Meteorological Organization publication, Climatological Normals (CLINO) WMO/OMM-No. 117 T.P. 52 or are values supplied by the respective authorities.

GROUPING OF STATIONS AND ARRANGEMENT OF DATA

The six volumes of the World Weather Records have been so arranged as to provide a natural geographic separation into what are essentially units of a single continent. Two of the volumes, however, contain island and Ocean Weather Station data as well as those of the smaller continents. Insofar as possible the National Climatic Data Center has also drawn upon the World Meteorological Organization structure for guidance.

Within each volume, the data are presented alphabetically by station within geographic areas which usually, but not necessarily, coincide with political entities.

Two indexes have been included in the rear of this volume to locate desired information. The first is a master list of all locations (station or area) included in this volume, listed alphabetically without regard to geographical division or country. In the second index, station names are listed in alphabetical order for each major geographical area or country.

The data tables for each station are headed with the station name, the geographic subdivision or country name, the WMO number whenever one has been assigned, the latitude, the longitude, and the station height above mean sea level. Unless otherwise noted in the Station Notes, the information presented in the table headings were those in use at the close of the period for which data are published. Also included in the headings is the page number where the Station Notes are located.

ADJUSTMENTS FOR HOMOGENEITY

World Weather Records published after the 1941-50 issue have not provided for homogeneity of records by adjusting the most recent period to the earlier period. In the 1951-60 volume and subsequent volumes, data have been published as received. No attempt has been made to correct for relocation of stations or changes in instrumentation or procedures. Any factors which might affect the homogeneity of the record have been included in the Station Notes whenever supplied.

UNITS OF DATA AND STATION NOTES

Measurements in the data tables and Station Notes are presented in metric units.

The totals of precipitation are understood to include all forms of precipitation: rain, snow, sleet, hail, etc. The letter "T" denotes an unmeasurable amount of precipitation.

METHODS OF AVERAGING

Unless otherwise described in Station Notes, monthly period means are the sums of the monthly means divided by the number of years for which data are available. Five or more years of monthly means are required for computation of monthly period means. Annual means of pressure and temperature are the average of the monthly or period means.

ERRATA

When errata have been provided for previous volumes, they are published in Station Notes.

ABBREVIATIONS AND SYMBOLS

Hp : Height (above mean sea level) to which station pressure shown in this volume has been reduced. If different heights have been used for different periods, the information is contained in station notes.

Hz : Height of the barometer above mean sea level for the period shown.

H : Height of the ground at the station above mean sea level.

ht : Height of the thermometer above ground.

hr : Height of the rim of the precipitation gauge above ground.

Lat. : Latitude of the station.

Long. : Longitude of the station.

E : Data have been estimated by the method described in station notes for that station, or based on incomplete data, or are uncertain for some other reason.

NORTH AMERICA

STATION NOTES

NORTH AMERICA

STATION NOTES

ALASKA (24 stations)

General:

Station names, elevations, and coordinates given in the table headings were those in use at the end of 1980 or the last year for which data were published. For stations having pressure data, the elevation Hp, height to which station pressure has been reduced, is used in the table heading. For stations without pressure data, the elevation is H, height of the ground above mean sea level.

CLINO values represent the 1951-80 period. The monthly means and totals have not been adjusted for site changes.

Station and Sea Level Pressure:

Monthly means were computed by the equation:

$$1/8\ (00 + 03 + 06 + 09 + 12 + 15 + 18 + 21)\text{hours GMT}$$

The above method was also used in the 1961-70 volume to compute the monthly pressure means but was stated incorrectly in the 1961-70 Station Notes.

The following formula was used in order to adjust station pressure to the climatological station pressure height:

$$PHpc = PHp \exp \left[(Z2 - Z1) / R\,T^{*} \right]$$

where: T^{*} is the mean virtual temperature and is assumed to be approximated by the actual hourly temperature in degrees Kelvin.
$Z2 - Z1$ is the difference in geopotential meters between the station pressure observation height and the climatological station pressure height which is approximated by the difference in elevation of the two heights in actual meters.
R is the univeral gas constant.
PHp is the hourly station pressure.
PHpc is the hourly climatological station pressure.

Temperature:

Monthly mean temperature was computed by one-half the sum of the monthly mean daily maximum and the monthly mean daily minimum temperatures.

Precipitation:

These data were measured using either a weighing, a triple register, or an eight inch rain gauge. Monthly values represent the sums of the daily totals.

STATION NOTES

CANADA (74 stations)

General:

Station names, elevations, and site descriptions remain the same as those published in the 1961-70 volume with the exception of those listed at the end of the Canadian Station Notes. CLINO values are unadjusted and based on the 1951-80 period.

Station and Sea Level Pressure:

Monthly mean pressure values represent the average of the 24-hour observations. Station pressure was adjusted to the climatological station pressure height (Hpc). At those stations where the barometer cistern height is less than 15.2 meters (50 feet) above mean sea level (MSL), an established elevation of the datum MSL is assigned.

Temperature:

Monthly values represent the average of the mean daily maximum and the mean daily minimum.

Precipitation:

Total monthly precipitation consists of the rainfall plus the snowfall water equivalent or the rainfall plus 1/10 of the snowfall.

Station Name Change:

Trout Lake changed to Big Trout Lake; Torbay changed to St John's.

Site Description for Edmonton Intl. A, Alberta:

An airport situated 16 km south of the Edmonton city limits. Surroundings are farmland with occasional wooded areas. ht-1.1m hr-1.4m.

MEXICO (56 stations)

General:

No station notes were received. However, the notes are assumed to be the same as those published in the 1961-70 volume and are summarized here.

The tables presented are, for the most part, summaries of observations taken daily at 7, 14, and 21 hours local time. The monthly total rainfall is the sum of the daily readings taken at 0800. Rain gauges have a diameter of 0.226 meters and are installed at an elevation of 1 meter above the ground. Thermometers are installed in wooden shelters at an elevation of 1.5 meters above the ground.

The height above sea level for each station has been determined either from levels furnished by the Railway Company or by calculations using simultaneous barometric observations between the respective meteorological station and other observations where height is known.

STATION NOTES

UNITED STATES (107 stations)

General:

Station names, elevations, and coordinates given in the table headings were those in use at the end of 1980 or the last year for which data were published. For stations having pressure data, the elevation Hp, height to which station pressure has been reduced, is used in the table heading. For stations without pressure data, the elevation is H, height of the ground above mean sea level.

CLINO values represent the 1951–80 period. The monthly means and totals have not been adjusted for site changes.

Station and Sea Level Pressure:

Monthly means were computed by the equation:

$$1/8\ (00 + 03 + 06 + 09 + 12 + 15 + 18 + 21)\text{hours GMT}$$

The above method was also used in the 1961–70 volume to compute the monthly pressure means but was stated incorrectly in the 1961–70 Station Notes.

The following formula was used in order to adjust station pressure to the climatological station pressure height:

$$PHpc = PHp \exp [\ (Z2 - Z1)\ /\ R\,T^*\ ]$$

where: T^* is the mean virtual temperature and is assumed to be approximated by the actual hourly temperature in degrees Kelvin.
$Z2 - Z1$ is the difference in geopotential meters between the station pressure observation height and the climatological station pressure height which is approximated by the difference in elevation of the two heights in actual meters.
R is the univeral gas constant.
PHp is the hourly station pressure.
PHpc is the hourly climatological station pressure.

Temperature:

Monthly mean temperature was computed by one-half the sum of the monthly mean daily maximum and the monthly mean daily minimum temperatures.

Precipitation:

These data were measured using either a weighing, a triple register, or an eight inch rain gauge. Monthly values represent the sums of the daily totals.

STATION NOTES

UNITED STATES – LAKE LEVELS (6 stations)

General:

Mean monthly lake levels are in meters above mean water level at Father Point, Quebec, International Great Lakes Datum (1955). Data were supplied by the U.S. Department of Commerce's NOAA – National Ocean Survey, Lake Survey Center.

Data published in the 1961-70 volume for Lake Michigan were in error. The correct 1961-70 data are published in this volume.

Lake	Site of Reading
Lake Erie	Cleveland, Ohio
Lake Huron	Harbor Beach, Michigan
Lake Michigan	Milwaukee, Wisconsin
Lake Ontario	Oswego, New York
Lake St. Clair	St. Clair Shores
Lake Superior	Marquette, Michigan

ZURICH SUNSPOT NUMBERS

General:

The Zurich scale for relative sunspot numbers is based on the system originated by Wolf in 1848. This standard number has been derived in Zurich but is currently being derived in Brussels. The daily index (R) is computed by the equation:

$$R = k (10g + s)$$

where: g is the number of sunspot groups.
s is the number of individual spots.
k is an observation constant.

The value of k is equal to one at the Zurich Observatory and adjusted at all other locations to account for differences in observer judgement, equipment, and seeing conditions.

These data were previously published in the volume for Europe.
